Hi Dave,

I was a student in the last class you taught on Sybase/SQL. I'm working on
a VB app and had some ?'s on parameterized SQL queries. You suggested I
email you for some examples.

Here's what I was doing that didn't work:

```
set cmd.ActiveConnection = cn
ssql = "SELECT EMEENAMM from EMPLOYEE where EMEENAMM>'letter'"
cmd.CommandText = ssql
set parmTemp = cmd.CreateParameter("letter", adChar, adParmInput, 1)
cmd.Parameters.Append parmTemp
cmd("letter") = "d"
set rs = cmd.Execute(lrecs, , adCmdText)
```

Using a stored procedure in access worked fine this way. It's just the SQL
syntax I don't know.

Any examples along these lines would be greatly appreciated.

Thanks for the help and a great class, Hope you're enjoying being in
Manhattan for awhile, Kathy Evans

Dave,

That worked great! Thanks for all your help and putting out that extra
effort.

It's appreciated.

Kathy Evans
